OPTIMA T1
Single Channel Critical Speed Switch
MODEL 13-7100

DESCRIPTION
The OPTIMA T1, Model 13-7100 is one in a series of critical speed switches that monitor speed and detect motion in all types of machinery and apparatus. Complete with ramp-up timer, the 13-7100 monitors speed ranges of 60 - 800 RPMs. Models are available to meet any application requirement for underspeed, overspeed or zero speed detection. The OPTIMA T1 utilizes a non-contacting proximity sensor that may be remotely located up to two miles from the control unit. Its rugged NEMA enclosure is well suited to meet the environmental challenges of any industry. Ideal for conveyors, crushers, fans, motors and other rotating apparatus.

INSTALLATION
DISCONNECT AC Power before proceeding with instructions.

1. Mount the OPTIMA T1 control unit in a convenient location.
2. Make the following connections:
   A. Connect power cable to 120 VAC.
   B. Connect control cables to proper terminals in the motor control circuit.
   C. Connect EAGLE PROX SENSOR cable to the sensor connector on the control unit.
3. Install sensor at roller. See sensor installation sheet.

SETUP AND TESTING
Final calibration should be performed with the belt loaded and running at normal speed.

1. Adjust ramp-up timer (TMR1) for desired ramp-up time (0-10 seconds)
2. Turn SPEED ADJUST potentiometer (SPD1) CCW until it stops (approximately 7 o'clock).
3. Hold SW1 switch in SET* position to energize relay.
4. Turn SPEED ADJUST pot CW SLOWLY until CRITICAL SPEED LED stays on continuously.
5. Continue turning SPEED ADJUST pot CW until MARGIN LED begins to blink. *
6. After RELAY LED is illuminated, return switch to RUN position.
7. There is a "safety delay" built into all EAGLE units. This delay leaves the control relay un-energized for 2.5 seconds after critical speed has been achieved to prevent false machinery actuation during maintenance or assembly. For the Eagle 3, channel 1 is adjustable from 0 – 10 seconds using TMR1.
8. Return switch to RUN position.
9. A momentary TEST* position is provided to simulate the loss of sensor signal which releases the control relay.

** Using the above calibration, the control relay will drop out at a machinery slowdown of approximately 15%. For a 20% MARGIN, adjust the SPEED ADJUST control so that the MARGIN LED just comes on steady. For a 10% MARGIN, adjust the SPEED ADJUST control CCW so that the MARGIN LED has just gone out.

* TEST position is up and SET position is down

** Using the above calibration, the control relay will drop out at a machinery slowdown of approximately 15%. For a 20% MARGIN, adjust the SPEED ADJUST control so that the MARGIN LED just comes on steady. For a 10% MARGIN, adjust the SPEED ADJUST control CCW so that the MARGIN LED has just gone out.

Note – Not all models will have the controls & indicators shown above
FIRST OUT OPERATION

The EAGLE OPTIMA “First Out” capability enables the user to visually see (by an LED indicator) if the slip switch relay contacts were the first to open. Once the belt is running and the control relay in the OPTIMA unit has energized, the First-Out indication (if activated) will extinguish. If the belt begins to slip and the OPTIMA unit shuts the drive down, the First-Out LED will illuminate. This LED will stay lit until the belt is restarted and the control relay in the OPTIMA unit has energized. If R1, R2, or R3 (See TYPICAL BELT STARTER) would open, this would shut the drive down and also the slip switch contacts would open. But, the First-Out LED would not be illuminated. This would allow the user to see that the slip switch relay contacts were not the first to open and cause the shutdown. A 9V battery holds the First-Out LED on if power to the unit is shut off or lost.

* Proximity Sensor Required for Proper Operation

EAGLE/OPTIMA SETTINGS

If switch 4 is open, then the unit is set to operate as a standard Eagle unit. The First Out LED will not operate in this mode. If switch 4 is closed, then the unit is set to operate as an Optima unit. In this mode the external control circuit should be wired through the set of contacts labelled “First Out” on the wiring chart. If the speed drops below the set point that was calibrated during setup, then the relay will turn off and the First Out LED will illuminate. If an external action caused the belt to shut down (i.e. pull cord, loose wire, external shutoff) then the First Out LED will be off when the relay opens.

AC Input 120 VAC 15 W
Fuse Protected 1 amp
Operating Temperature -40°C - +60°C (-40° - +140°F)
Speed Range 60 - 800 RPM
Relay Contacts DP/DT 5 amp @ 120 VAC
First-Out AC Current Range 17mA – 5 amps
First-Out LED Battery Back-Up 9V Rechargeable
Ramp-up Timer 0-10 Seconds, Adjustable
Safety Delay 2.5 Seconds
Response Time 1 Second or Less
Enclosure Hinged fiberglass with window / NEMA 4, IP66

PROX SENSOR
Inductive Proximity Type
MODELS 10-7135, 10-7136, 10-7139

DESCRIPTION
The Eagle® Proximity Sensor is designed to measure signals from any rotating apparatus and transmit this information by low-voltage 2-conductor twisted pair cable back to an Eagle control unit located up to 2 miles away. This sensor’s inductive proximity technology is further enhanced with additional circuitry to reduce or eliminate the adverse effects of electrical noise. This sensor can easily be identified by its bright orange end-cap(s).

COMPATIBILITY
Eagle Proximity sensors are compatible with all Eagle Speed Switches and Dust Suppression Systems with the exception of the Eagle 2, Model 11-7000, which lacks our pulse conditioning circuitry.

THEORY OF OPERATION
The Eagle Proximity type sensor senses a target as it approaches the internal oscillator coil encapsulated in the sensor head. When the target approaches the front of the coil, this causes a decrease in the amplitude of the internal oscillator. This damping effect can be sensed at any RPM, thus the sensor can be used to sense speeds below 1 RPM and as high as several thousand RPM's. Because this type of sensor is not sensitive to the speed of the targets, the sensing distance remains approximately 1/8” at any speed. This eliminates “missed” targets as monitored speed changes.

INSTALLATION
1. Select the roller or shaft to be monitored. If a roller is to be monitored, be sure it is always contacting the belt.
2. Affix a target on the roller or shaft. The target should be a piece of key-stock, 1/4-20 Hex Nut, etc. (Figure 1) NOTE: The use of a notch or a dent is not an acceptable target for the prox sensor. This sensor must see the presence of a target, not an absence of a target as there would be with a notch or dent.
3. Mount sensor firmly with hose clamps or U-bolts to prevent it from moving or working loose. Tape is NOT recommended as a fastener.
4. Before tightening, check that the target passes through the center area of the sensor face. This will produce the greatest sensitivity and sensing distance. With the roller or shaft spinning, move the sensor toward the target. The LED on the sensor should blink in direct proportion to the speed of the shaft or roller. Effective distance between the sensor and target is approximately 1/8 inch.

**NOTE - Shielded cable is recommended for all above ground applications. The shield of the cable should be attached to earth ground within 2 feet of the sensor head. In severe noise environments, grounding the shield at the control module also, will eliminate any E.M.I. interference.

10-7135 SPECIFICATIONS

| Dimensions | 4.12 in. x 1.32 in. O.D. |
| Sensor Type | Inductive Proximity (Metal) |
| Housing / Mounting | PVC / General Mount |
| Sensor Power Requirement | Current Limited 12VDC from Control |
| Unit Sensor Cable | Unshielded** Twisted Pair 16/2 - 50 Ft. with Connector |
| Distance | Sensor to Control Unit - 2 Miles |
| Operating Temperature Range | -40°C to 145°C / -40°F to 293°F |
| Minimum Sensing Speed | Less than 1 RPM |
PROX SENSOR
*Inductive Proximity Type*

MODELS 10-7135, 10-7136, 10-7139

### 10-7136 Specifications

- **Dimensions:** 4.91 x 1.30 in. O.D.
- **Sensor Type:** Inductive Proximity (Metal)
- **Housing / Mounting:** PVC / Conduit Mount
- **Sensor Power Requirement:** Current Limited 12VDC from Control
- **Unit Sensor Cable:** Unshielded **Twisted Pair 16/2 - 3 Ft. Pigtail**
- **Distance:** Sensor to Control Unit - 2 Miles
- **Operating Temperature Range:** -40°C to 145°C / -40°F to 293°F
- **Minimum Sensing Speed:** Less than 1 RPM

### 10-7139 Specifications

- **Dimensions:** 4.12 x 1.32 in. O.D.
- **Sensor Type:** Inductive Proximity (Metal)
- **Housing / Mounting:** Threaded PVC / Conduit or Bracket Mounting
- **Power Requirement:** Current Limited 12VDC from Control Unit
- **Unit Sensor Cable:** Unshielded **Twisted Pair 16/2 - 3 Ft. Pigtail** (10-7139-50 has 50’ Pigtail)
- **Distance:** Sensor to Control Unit - 2 Miles
- **Operating Temperature Range:** -40°C to 145°C / -40°F to 293°F
- **Minimum Sensing Speed:** Less than 1 RPM
